TECH STACK

The Modern Lender's Tech Stack: A 2026 Field Guide

What private lending technology actually looks like when it's working.

THE PROBLEM

Most lending stacks weren't designed — they accumulated

Each tool was a reasonable decision in isolation. CRM, pricing spreadsheet, doc platform, pipeline tracker. None were chosen with the others in mind. The result: manual handoffs masquerading as a system.

LAYER 1: PRICING

One source of pricing truth

The rate sheet should be accessible to every authorized user, always current, and connected to the deal record. If pricing lives in a document someone maintains, it can drift — and that drift is invisible until a deal closes wrong.

Borrower record = deal record

When CRM and pipeline are unified, the borrower profile follows the deal. No re-entry. No duplicate records. The LO sees the full history: previous deals, preferences, communication log.

LAYER 3: AUTOMATION

The handoffs that should be automatic

Quote accepted → term sheet generated. Deal closed → borrower record updated. Month end → report ready. These aren't complex automations. They're the difference between a business that grows and one that scales by adding headcount.

LAYER 4: REPORTING

Data that's available, not assembled

Monthly metrics — realized margin, deal velocity, repeat borrower rate — should be pulled, not built. If reporting takes more than 30 minutes, you're assembling it manually. That's a system design problem.
