

EZ RATE SHEET

The 4-Step Loan Pricing Audit

Find where your margins are leaking — in under an hour.

STEP 1

Pull 10 recent quotes, same deal profile

Same LTV range, same property type, same borrower tier. How far apart are the rates? More than 25 bps variance is worth investigating. You'll find more spread than expected.

STEP 2

Map where pricing decisions actually happen

Is pricing pulled from one source of truth? Or from a spreadsheet, an email, or someone's memory? Document the actual path — not the intended one. There's usually a gap.

STEP 3

Count your manual touchpoints

How many times does a rate need to be confirmed, reformatted, or re-entered between quote and term sheet? Each one is a point of error and delay. Count them honestly.

STEP 4

Identify the single point of failure

If the person who manages your rate sheet is unavailable for 6 hours, what happens to a live deal? That answer reveals your actual operational risk — and the first thing to fix.
