

5 Signs Your Rate Sheet is Costing You Deals

None of these feel like emergencies. That's what makes them dangerous

SIGN 1

Quotes vary by who picks up the phone

If two LOs would price the same deal differently, your pricing isn't a system — it's a collection of individual habits. Margin leaks here silently, across every deal where guidelines have interpretive room.

SIGN 2

Your rate sheet is a document, not a system

If the source of truth is a spreadsheet someone maintains manually, it can drift from reality. And when it does, no one knows until a deal closes wrong or a margin variance appears in the monthly P&L.

Borrowers get ballpark instead of term sheets

"I'll confirm by end of day" loses more deals than a competitor's rate. Speed and precision aren't just service — they're retention strategies. Delayed quotes go to whoever answers faster.

Pricing decisions require escalation

If every edge case goes to the principal, pricing has become a bottleneck on the principal's calendar. That model doesn't scale past \$20M/month — and the ceiling appears earlier than expected.

SIGN 5

You can't explain your margin variance

If volume held but margins compressed and you don't know exactly why, that's not a data problem. It's a pricing architecture problem. The variance is in the system — it just isn't visible yet.
